Negative logic	On	Off	Off

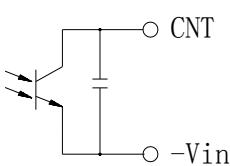

#### Various circuits for driving the CNT

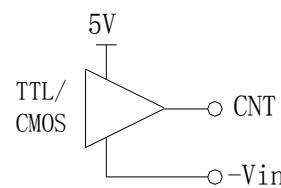

Simple control

Transistor control

Isolation control

Direct logic drive

#### Input Undervoltage Protection

The converter will shut down after the input voltage drops below the under voltage protection threshold for shutdown. The converter will start to work again after the input voltage reaches the input under voltage protection threshold for startup. For the Hysteresis, see the Protection characteristics.

#### Output Overcurrent Protection

The converter equipped with current limiting circuitry can provide protection from an output overload or short circuit condition. If the output current exceeds the output overcurrent protection set point , the converter enters hiccup mode. When the fault condition is removed, the converter will automatically restart.

**Overtemperature Protection**

A temperature sensor on the converter senses the average temperature of the module. It protects the converter from being damaged at high temperatures. When the temperature exceeds the over temperature protection threshold, the output will shut down. It will allow the converter to turn on again when the temperature of the sensed location falls by the value of Over temperature Protection Hysteresis

**Reverse Protection**

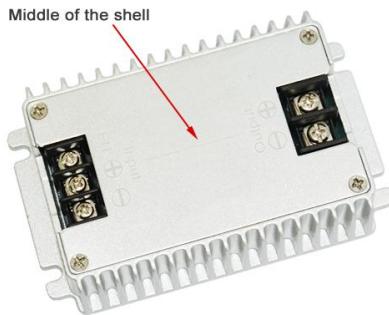

Reverse voltage protection circuits prevent damage to power supplies and electronic circuits in the event of a reverse voltage applied at the input terminals. The protection ensures that the components are not damaged by accidental swap of the power supply connections.

**Output Overvoltage Protection**

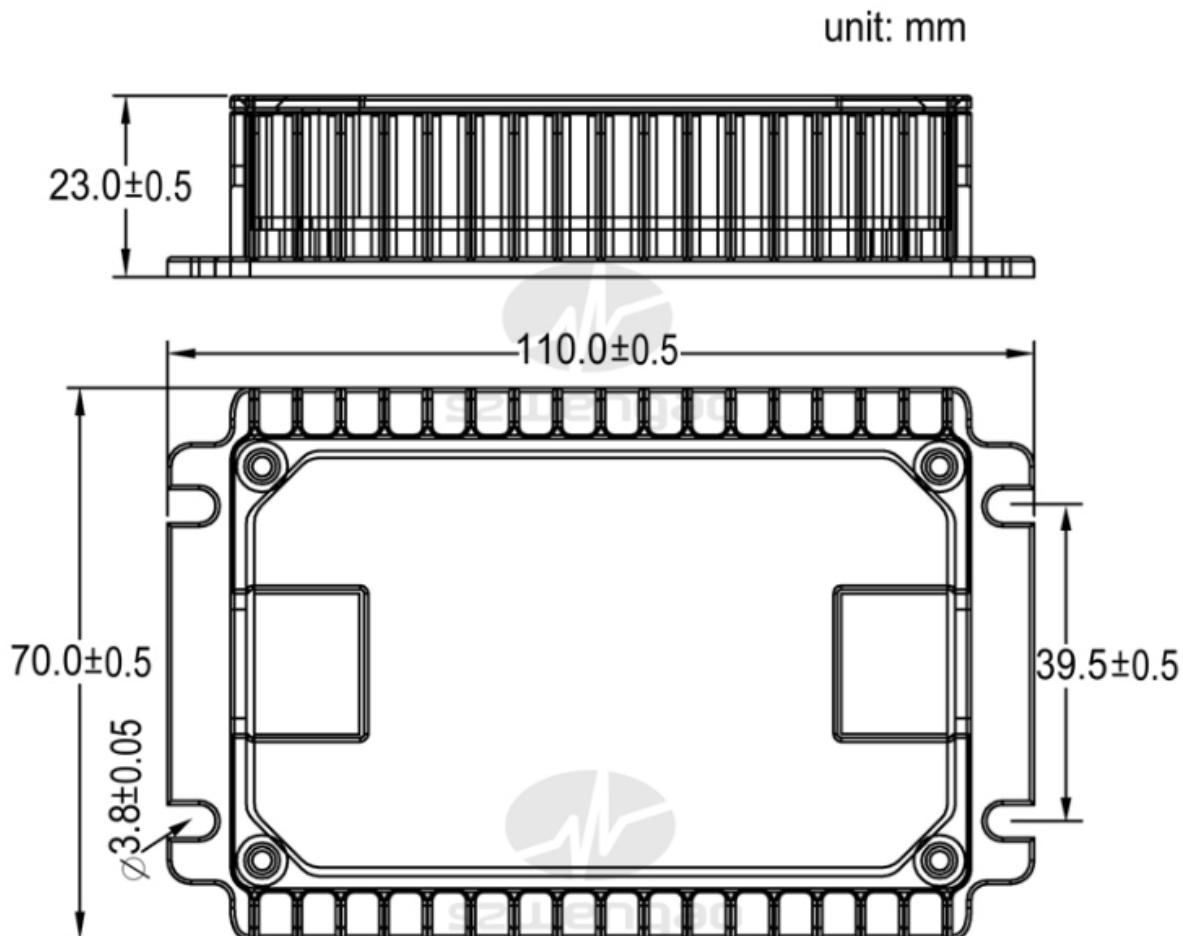

When the voltage directly across the output pins exceeds the output overvoltage protection threshold, the converter will enter hiccup mode. When the fault condition is removed, the converter will automatically restart.

**Thermal Consideration**

Sufficient airflow should be provided to help ensure reliable operating of the WGI05-48S24L. Therefore, thermal components are mounted on the top surface of the WGI05-48S24L to dissipate heat to the surrounding environment by conduction, convection and radiation. Proper airflow can be verified by measuring the temperature at the middle of the base plate.
